Abstract

Globalization gave rise to television, a significant source of instructional enrichment. It offers more comprehensive, advanced, and varied knowledge and instruction. Television has received a lot of flak for having a detrimental effect on secondary school pupils' academic achievement. Watching television could start to compete with studying time and eventually lead to poorer academic achievement. In this study, our aim was to identify the determinants of viewing Kana television programs on academic performance. To meet the objective, of the 1658 students, 138 were selected as a sample by using stratified random sampling. We gathered information from the sample of students by using primary and secondary data collection methods. Multiple linear regressions were used for data analysis, considering academic performance (the average mark after watching Kana TV) as the response variable. According to the descriptive statistic, 46.4% of students are males, and the remaining 53.6% are females because the total population of females is higher than males. 51.4% of students live in urban areas, and the remaining 48.6% live in rural area. 60.9% of students have access of satellite television and 39.1% of students have no access to satellite television. The major significant factors that affect the academic performance of students are age, religion, income, parent's follow-up (father's follow-up), access to satellite television, addiction to Kana television programs, and time spent.

Keywords

Academic Performance of Students, Kana Television, Multiple Linear Regressions

1. Introduction

Globalization gave rise to television, a vital source of educational enrichment [1].

The media industry has seen significant technical growth in the twenty-first century. All mass media platforms, includ-

ing television, are essential and unavoidable components that provide people with news, entertainment, and education. These days, one can watch television on the web, on a cell phone, or with a little pocket TV. Because of their seemingly

unrestricted access to the many types of materials, young children's usage of it in particular has raised discussions and worries among many scholars, since it may have an impact on their learning, behavior, growth, and health [2].

It offers more comprehensive, advanced, and varied knowledge and instruction. It provides amusement as well. This contributed to the nation's film industry's boom. Consequently, there was a noticeable surge in the number of moviegoers as the motion picture industry showed indications of becoming a major source of entertainment. It is generally acknowledged that, among other information sources, television has emerged as the source of the most widely disseminated pictures and messages in history. Because of this, students consume more media overall, with watching television, movies, or videos accounting for more than half of this time [3]. As a result, television was seen as a distraction during the teaching and learning process, and secondary school pupils now regularly share this perception [4].

Mass media includes publications including newspapers, periodicals, books, radio, television, movies, and other forms of communication that reach a large audience without requiring a personal connection between the sender and the recipient. Preschoolers who watch television perform worse academically and have a harder time picking up new languages [5].

Parents have reportedly expressed concern about their children's academic performance due to their withdrawal from academic pursuits, specifically not doing their homework, not studying, and receiving subpar exam results [6].

Actually, there has been a lot of criticism directed at television for its detrimental effects on secondary school students' academic performance. Watching television may start to compete with studying time and ultimately lead to worse academic achievement [7].

Too much time spending on television has adverse effects on School performance [8].

Due to viewers' reliance on foreign-based satellite television programming, the availability of satellite television in Ethiopia may have negatively impacted adolescent viewers' social interactions [9]. Schiller affirms that "watching foreign television can change one's values, and importing programs is importing lifestyles" [10].

Through exposure to satellite television, the research intends to define the time that youth allocate toward viewing satellite television, especially Kana programs. It is an Ethiopian general entertainment, free-to-air, satellite television channel that bringing international standard programming to Ethiopia [11].

2. Data and Methodology

2.1. Data

Primary as well as secondary gathering methods were used to get the data for this investigation. Gathering initial data is

the procedure by which we obtain original data from original sources using a questionnaire (a self-report tool designed to collect data about variables). Additionally, we use a secondary data gathering approach to establish the sample size by obtaining data from the register.

Sampling Design

Sampling Technique is a method of selecting sample from an entire population. For this study, we have used a stratified random sampling method. Since the nature of our target population forced us to use it in order to increase the prevalence of findings, thus, we used the classes as strata [12].

2.2. Methodology

In this study, the variable academic performance (average mark after watching Kana TV) is a continuous variable. When the response variable is continuous, it is appropriate to use multiple linear regression models to describe the relationship between the outcome variable and a set of predictor variables.

2.2.1. Multiple Linear Regression Analysis

Multiple regressions are a type of regression in which we have one dependent and more than two predictor variables. This model is used to study relationships among variables, and the model is given by:

$$Y_i = \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_k x_{ki} + \epsilon_i \quad (1)$$

Where: β_0 = intercept

$\beta_1, \beta_2, \dots, \beta_k$ is the coefficient of $x_1, x_2, x_3, \dots, x_k$, respectively.

Y_i = response variable [13].

Assumptions of Multiple Linear Regression Analysis

The assumption of multiple linear regression analysis is as follows: the response variable must be continuous.

There is a linear relationship between independent and dependent variables.

With an average of zero and constant variance, the error term has a normal distribution.

There is not a perfect linear correlation between the explanatory factors.

There is no relationship between the incorrect terms [14].

2.2.2. Model Diagnostics (Adequacy)

1. Assessing Error Terms' Normality

The normally distributed assumption is verified using the normal probability plot. This indicates that the standard deviation is one and that the error terms have a normal distribution with an average of zero.

2. Standardized Linearity Checking

The linear probability that they provide for the predictor variables is linearly related to the dependent variable, as demonstrated by the scatter plot of the dependent variables against the standardized predicted variable, which is used to

verify the linearity assumption of the MLR model.

3. Assessing Homoscedasticity

The variance of the error is constant. Residuals cannot vary for lower or higher values of X (i.e., fitted values of Y since $Y = X\hat{\beta}$). A Scatter plot of the standardized residual against the standardized predictor is used to check the dependency of the standardized residual on repressors.

4. Multicollinearity

VIF used to check multicollinearity. It is the relationship between regressors. Its diagnosis is VIF, where $VIF(B_j) = 1/(1 - R^2_k)$, R^2_k is the coefficient of determination of the auxiliary regression. If $VIF(B_j) = [1, 10]$, there is no multicollinearity, but VIF (B_j) out of the range indicates problem with it [15].

3. Results and Discussion

3.1. Descriptive Statistics

Table 1 show that the average time spent by respondents watching Kana television programs was 1.27 hours or one hour and 27 minutes per day. The average marks of students before starting the kana TV program and after starting the Kana TV program was 77.133 and 74.41, with a standard deviation of 8.7893 and 9.422 respectively. The minimum and maximum ages of students in this school were 14 and 21 respectively. The minimum and maximum time spent on Kana television were 1 and 4 hours respectively.

Table 1. Descriptive statistics for continuous variables.

| Statistics | age | time spent ⁺ | Mark | |
|----------------|-------|-------------------------|---------------------|---------------------|
| | | | Before [*] | After ^{**} |
| Mean | 16.67 | 1.27 | 77.133 | 74.41 |
| Std. Deviation | 1.457 | .986 | 8.7893 | 9.422 |
| Minimum | 14 | 1 | 58.0 | 45 |
| Maximum | 21 | 4 | 97.7 | 93.4 |

+ Time spent on Kana Television

^{*} Mark of students before Kana TV program starts and

^{**} Mark of students after Kana TV program starts

Table 2. Descriptive statistics for categorical variables.

| Variables | | Frequency | Percent (%) |
|-------------------|-------------|-----------|-------------|
| Sex | Male | 64 | 46.4 |
| | Female | 74 | 53.6 |
| Religion | Muslim | 33 | 23.9 |
| | Orthodox | 73 | 52.9 |
| | Catholic | 21 | 15.2 |
| | Protestant | 11 | 8.0 |
| | Merchant | 49 | 35.5 |
| Father Occupation | Government | 39 | 28.3 |
| | Farmer | 42 | 30.4 |
| | Daily labor | 6 | 4.3 |
| | Other | 2 | 1.4 |
| Mother Occupation | Merchant | 43 | 31.2 |
| | Government | 17 | 12.3 |

| Variables | | Frequency | Percent (%) |
|-----------------------------|------------------|-----------|-------------|
| Monthly Income | House wife | 78 | 56.5 |
| | <=1000 | 47 | 34.1 |
| | 1000_2500 | 57 | 41.3 |
| | >=2600 | 34 | 24.6 |
| Father follow up | Yes | 57 | 41.3 |
| | No | 81 | 58.7 |
| Mother follow up | Yes | 48 | 34.8 |
| | No | 90 | 65.2 |
| Residence | Urban | 71 | 51.4 |
| | Rural | 67 | 48.6 |
| | 9 th | 62 | 44.9 |
| Grade | 10 th | 51 | 37.0 |
| | 11 th | 10 | 7.2 |
| | 12 th | 15 | 10.9 |
| Satellite television access | Yes | 84 | 60.9 |
| | No | 54 | 39.1 |

Table 2 shows that 46.4% of students are males and the remaining 53.6% are females because the total population of females is higher than that of males. 23.9% of students follow the Muslim religion, 52.9% are orthodox, 15.2% are Catholic, and the remaining 8.0% of the students follow the Protestant religion. 34.1% of the students families have less than or equal to 1000 total family monthly income, 41.3% have between 1100 and 2500 total monthly income, and 24.6% of students have greater than or equal to 2600 total monthly

income. 51.4% of students live in urban areas, and the remaining 48.6% live in rural areas. Table 2 revealed that 44.9% of students are in grade 9th, 37.0% are in grade 10th, 7.2% are in grade 11th, and the remaining 10.9 percent of students are in grade 12th. 60.9% of students have access to satellite television, and 39.1% of students have no access to satellite television. 53.6% of students are addicted to Kana television programs, and 46.4 percent are not addicted to television programs.

3.2. Multiple Linear Regressions Analysis

Table 3. Model summary.

| Model | R | R Square | Adjusted R ² | Std. Error of the Estimate |
|-------|-------------------|----------|-------------------------|----------------------------|
| 1 | .934 ^a | .872 | .834 | 3.787 |

Table 4. The overall test of the model (ANOVA).

| ANOVA ^b | | | | | | |
|--------------------|------------|---------------|-------------------|-------------|-------|------------------|
| Model | | Sum of Square | Degree of freedom | Mean Square | F | Sig. |
| 1 | Regression | 7977.63 | 24 | 332.40 | 23.17 | .00 ^a |

| ANOVA ^b | | | | | |
|--------------------|---------------|-------------------|-------------|---|------|
| Model | Sum of Square | Degree of freedom | Mean Square | F | Sig. |
| Residual | 1175.97 | 82 | 14.34 | | |
| Total | 9153.60 | 106 | | | |

The model summary from [table 3](#) shows that $R^2 = 0.872$, which indicates that 87.2% of the variation (change) in the response variable (the average mark after starting the Kana TV program) is explained by the explanatory variables, while 12.8% of the outcome variable is influenced by the other explanatory variables that are not included in the study. Therefore, the model fits the data well.

Over all, hypothesis testing for coefficients $H_0: \beta_i = \beta_j = 0$ V_S H_1 : Independent variables have at least one coefficient that deviates from zero. Interpretation: As we know from the ANOVA table, the overall test of the model, value = 0.000, is less than p value of 0.05. Therefore, reject H_0 , so the model is significant. This is an indication of the goodness of the model. It can be said that the model fit the model well.

Table 5. Model of multiple linear regression coefficients.

| Model | Unstandardized Coefficients | | Standardized Coefficients | T | Sig. |
|--|-----------------------------|------------|---------------------------|--------|------|
| | B | Std. Error | Beta | | |
| (Constant) | 23.660 | 11.792 | | 2.006 | .048 |
| sex of respondents | .437 | .808 | .023 | .541 | .590 |
| age of respondents | -1.309 | .514 | -.206 | -2.547 | .013 |
| Muslim | .265 | 1.005 | .012 | .264 | .793 |
| Catholic | -.510 | 1.120 | -.021 | -.455 | .650 |
| Protestant | -3.375 | 1.463 | -.101 | -2.307 | .024 |
| Merchant (Father) | -5.398 | 3.034 | -.286 | -1.779 | .079 |
| government employed (Father) | -.203 | .932 | -.011 | -.218 | .828 |
| Farmer (Father) | -4.660 | 3.095 | -.207 | -1.506 | .136 |
| daily labor (Father) | -6.038 | 3.853 | -.124 | -1.567 | .121 |
| Merchant (Mother) | .518 | .879 | .026 | .589 | .557 |
| government employed (Mother) | -2.349 | 1.316 | -.088 | -1.785 | .078 |
| less than or equal to 1000 | 2.312 | 1.045 | .119 | 2.212 | .030 |
| between 1100 and 2500 | .386 | .973 | .020 | .397 | .693 |
| respondents father follow-up | -6.733 | 3.213 | -.342 | -2.096 | .039 |
| respondents mother follow-up | -1.144 | .875 | -.059 | -1.307 | .195 |
| residence of respondents | -1.098 | .959 | -.059 | -1.145 | .255 |
| grade nine | -3.451 | 2.641 | -.185 | -1.307 | .195 |
| grade ten | -.710 | 2.025 | -.037 | -.351 | .727 |
| grade eleven | 1.733 | 2.118 | .052 | .818 | .416 |
| access of satellite television for respondents | 2.178 | .857 | .117 | 2.541 | .013 |
| addiction of respondents on kana program | 2.810 | 1.096 | .150 | 2.564 | .012 |

| Model | Unstandardized Coefficients | Coefficients | Standardized Coefficients | T | Sig. |
|---|-----------------------------|--------------|---------------------------|--------|------|
| | B | Std. Error | Beta | | |
| time spent on kana television for respondents | -1.164 | .420 | -.124 | -2.771 | .007 |
| peer pressure of individuals on respondents | 2.183 | 1.158 | .111 | 1.884 | .063 |

From the above SPSS output table 5, it shows that sex, parents occupation, parent follow-up (mothers follow-up), residence, grade level, and peer pressure were not significant, because all p-values were higher than the significance level ($\alpha=0.05$), but age, religion, income, parents follow-up (fathers follow-up), access to satellite television, addiction to Kana television programs, and time spent were significant since all p-values were less than the level of significance ($\alpha=0.05$).

$$\hat{y}=\beta_0+\beta_2X_1+\beta_3D_2+\beta_5D_4+\beta_6D_{51}+\beta_9D_8+\beta_{10}D_9+\beta_{11}X_2+\varepsilon$$

$$\hat{y}=23.660-1.309X_1-3.375D_2+2.312D_4-6.733D_{51}+2.178D_8+2.810D_9-1.164X_2+\varepsilon$$

4. Conclusion and Recommendation

The results of the data analysis show that the most important factors impact the academic performance of students. These factors are age, religion, income, parent follow-up (fathers follow-up), access to satellite television, addiction of individuals to Kana television programs, and time spent, but sex, parent occupation, parent follow-up (mothers follow-up), residence, grade level, and peer pressure are insignificant with academic performance.

The students who spent their time on Kana television programs are not satisfied with their average marks, and they are addicted to Kana. Their daily interest in satellite television access increased rather than studying their course because the majority of respondents had satellite television access with Kana and had knowledge of viewing Kana television programs. Thus, their average marks were affected, and their average marks decreased after they had been watching Kana television programs. This study suggests that in order to decrease the amount of time kids spend watching television; teachers must give them enough homework to keep them occupied during downtime. Schools ought to guide parents on how to monitor and look into their children's media consumption. Because movies are able to present events that look real and pertinent to every detail in a way that is suitable for teaching, the government must completely support this course.
